# Отчёт по лабораторной работе №

# по курсу «Языки и методы программирования».

Выполнил студент группы M8O-111Б-23: Воробьев Глеб Янович № по списку 5.

KOHTAKTSI. KOSHASTELI 5 (MgHIAII. COIII
Работа выполнена: «28» февраля 2024 г.
Преподаватель: каф. 806 Никулин Сергей Петрович
Входной контроль знаний с оценкой:
Отчет сдан «29» февраля 2024 г.
Итоговая оценка:
Подпись преподавателя:

#### 1. Тема:

Абстрактные типы данных, рекурсия, модульное программирование на ЯП Си. Автоматизация сборки программ модульной структуры с использованием утилиты make.

#### 2. Цель работы:

Применение различных сортировок к различным типам данных и обучение по работе с утилитой make.

#### 3. Задание:

АТД - дек, процедура - поиск и удаление максимального и минимального элемента, метод - сортировка линейным выбором

#### 4. Оборудование:

Процессор AMD Ryzen 5 7640HS.

ОП 16 ГБ.

SSD 512 ГБ.

Монитор 2560x1600~165Hz.

#### 5. Программное обеспечение:

Операционная система семейства Unix.

Наименование Ubuntu версия 22.04.3.

Интерпретатор команд GNU bash версия 6.2.0.

Система программирования -.

Редактор текстов Visual Studio Code.

# 6. Идея, метод, алгоритм решения задачи:

Код реализует поиск максимального и минимального элемента в деке, который представлен как кольцевой буфер. Реализация дека представлена в файлах udt.c и udt.h. RemoveMin для удаления минимального элемента из дека и selectionSort для сортировки дека методом сортировки выбором.которая представлена в файле main.c

# содержание main.c:

- 1. RemoveMin(deque \*d): Начинается с сохранения первого элемента дека как текущего минимального. Проходит через все элементы дека, перемещая их с "головы" на "хвост" и сравнивая их с текущим минимальным значением. Если новый элемент меньше текущего минимального, обновляет минимальное значение и индекс минимального элемента. После прохода по всему деку, проходит по деку второй раз, удаляя минимальный элемент (не добавляя его обратно). Возвращает значение минимального элемента.
- 2. selectionSort(deque \*d): Создает новый пустой дек, который будет использоваться для хранения отсортированных элементов. Пока исходный дек не пуст, вызывает RemoveMin для нахождения и удаления минимального элемента и добавляет этот элемент в конец нового отсортированного дека. После того как все элементы перемещены в отсортированный дек, перекладывает их обратно в исходный дек (этот шаг на самом деле не нужен, если мы хотим сохранить отсортированный дек). Возвращает новый отсортированный дек.
- 3. printDeque(deque \*d): Функция печати элементов дека на экран. Выводит все элементы дека с начала до конца, учитывая кольцевую структуру дека и начальный индекс head.
- 4. main(): Главная функция, которая предоставляет пользователю меню для взаимодействия с деком. В меню есть опции для добавления элементов в голову или хвост дека, печати минимального и максимального элемента, удаления минимального и максимального элемента, проверки размера и пустоты дека, а также для печати всех элементов дека.

Для компиляции используется утилита make

## 7. Сценарий выполнения работы:

```
makefile
```

```
all:
gcc main.c udt.c
```

```
udt.h
```

```
#ifndef _UDT_H_
#define _UDT_H_
#define POOL SIZE 100
typedef struct {
  int tail;
  int size;
void PushHeadDeque(deque *d, int key);
void PushTailDeque(deque *d, int key);
void PopHeadDeque(deque *d);
void PopTailDeque (deque *d);
int TopHeadDeque(deque *d);
int TopTailDeque(deque *d);
void CreateDeque(deque *d);
void deleteDeque(deque *d);
int getSizeDeque(deque *d);
int isEmptyDeque(deque *d);
#endif
```

### udt.c

```
#include <stdio.h>
#include "udt.h"

void CreateDeque(deque *d)
{
    d->head = 0;
    d->tail = 0;
    d->size = 0;
}

int isEmptyDeque(deque *d)
{
    return d->size == 0;
}
```

```
int getSizeDeque(deque *d)
  return d->size;
void PushHeadDeque(deque *d, int key)
  if (d->size == 0) {
      d->data[d->head] = key; // Вставляем элемент в текущую позицию
      d->data[d->head] = key; // Вставляем элемент в позицию перед
